Deep Networks
Expert understanding
problem structure
in the form
of network layers

It is good that COORD-19 has subsidized

$$z^{(t)}[l, d, p'] = \sum_{l=0}^{d-1} \sum_{u,v=0}^{k-1} z^{(t)}[l+u, d+v, e] \cdot w[u, v, l, p'] + b[p']$$

$$z^{(t+1)}[l, d, p'] = g(z^{(t)}[l, d, p'])$$

n's & n d'-1?

$\varepsilon < \delta$ $\forall \varepsilon > 0$ $\exists \delta > 0$

$$\chi^{(f+1)}[l, \partial, e'] = \frac{1}{b^2} \sum_{a,b=0}^{b-1} \chi^{(f+1)}[lf + a\partial + be']$$
